

NEXUS

Business Intelligence Control Room

Project Documentation
Built by Praneeth Bangari

Project Overview

NEXUS is a real-time Business Intelligence dashboard that provides live insights into client revenue, industry distribution, conversion funnels, and user engagement metrics. The system integrates a Telegram bot for remote data management, n8n for workflow automation, and Excel/Google Sheets as the data backend — making it a powerful, no-database business tool.

Tech Stack

Technology	Purpose
React + Vite	Frontend SPA Framework
TanStack Router	Client-side Routing
Tailwind CSS	UI Styling
Recharts	Charts & Data Visualization
n8n	Backend Workflow Automation
Telegram Bot	Remote Data Management Interface
Excel / Google Sheets	Data Storage & Management
Vercel	Frontend Hosting & Deployment
GitHub	Version Control
Lovable + Antigravity	AI-Assisted Development

Key Features

- Real-Time Dashboard:** Live business metrics including Total Revenue, Active Clients, Average Deal Size, and Top Client — all updating in real time.
- Revenue Trend Chart:** Cumulative revenue visualization across all clients using an area chart with interactive tooltips.

Industry Distribution: Donut chart showing revenue breakdown by sector (Finance, Tech, and others).

Conversion Funnel: Visual funnel tracking leads from initial contact through Qualified, Proposals, Negotiations, to Won deals.

User Engagement: 24-hour activity line chart showing platform engagement trends.

Performance Indicators: Circular KPI charts showing Conversion Rate, Retention, Engagement, and Satisfaction metrics.

Client Insights Table: Complete client list with Industry, Gmail, Revenue, and Share data in a sortable table.

Telegram Bot Integration: Send commands via Telegram to view client data, update amounts, add new clients, and send email notifications.

n8n Automation: Backend workflows handle Telegram commands, Excel updates, Gmail sending, and data synchronization automatically.

Excel/Sheets Backend: All client data stored in Google Sheets / Excel — no traditional database required.

How It Works

1. Data is stored in Google Sheets / Excel with columns: Client, Amount Paid, Industry, Gmail.
2. The React frontend fetches and displays this data in real-time as charts and tables.
3. The Telegram bot (powered by n8n) allows you to send commands like 'give me all client details' or 'change amount paid of [client] to [amount]'.
4. n8n workflows process these commands, update the Excel sheet, and send Gmail notifications automatically.
5. The dashboard reflects all changes in real time without any manual refresh.

Telegram Bot Commands

Command	Action
give me all client details	Returns full list of all clients with data
change [client] amount to [value]	Updates client revenue in the sheet
send gmail to [client] about due amount	Sends automated email notification
add new client [details]	Adds a new client record to the sheet

Deployment

Live URL: nexus-project1.vercel.app

GitHub: github.com/praneethbangari06-hash/nexus-project1

Platform: Vercel (Frontend) + n8n (Backend)
